

ENOLOGIX® QMS™ CONSULTING REPORTS

DIAGNOSTIC REPORT CREATED USING QMS™ DATABASE

Predicting 2001 Quality Potential

Drain-down wine quality potential for the 2001 vintage increased for Cabernet and Syrah over the 2000 vintage. Scores also increased for Pinot Noir over 1998 quality.

QUALITY PERCENTILE OF 5-YEAR HIGHS.

Vintages	Q5-Index	National Critics'
2001	85%	good
2000	84%	good
1999	98%	excellent
1998	64%	poor

What is the Enologix Q5-Index™?

We offer the technical comparison of quality over time in the Q5-Index.

Enologix has tracked wine quality since 1989 using exactly the same metrics in a standard report. This allows us to benchmark today's wines.

Enologix Q5-Index is the average quality (Index column in the WineFAX) compared to recent 90-point vintages. It is calculated by searching our database by time segments. We typically assess vintages by assessing wines assayed between September 1st and October 16th each year. The average style, quality, or aging potential are divided by the 5-year highs. This year we divided Cabernet Sauvignon by the 1999 vintage. Similarly, we divided Pinot Noir by the 1999 vintage.

HOW TO:

Predict Your Quality: Use Q5% to diagnose the vintage in general. Determine whether your grapes or winemaking have beat the averages. If you are satisfied with your quality, barrel wines down now. Beware of blending low into high quality wines for 90 days (until January 1st). We are predicting poor stability of color in wines made in September for both Merlot and Pinot Noir.
